

Git instructions 2020 -2021

At the beginning of each session, get the new files you need for the day:

git pull upstream main

At the end of each session, commit and push your changes to your own repository

git add . (to add all the changes)

git commit -m "my commit" (replace my commit with whatever message you want, keeping the quote marks)

git push

Other things:

- When you pull you will sometimes get a message saying that the changes are merging.
To exit this message you can type

<esc> :q <return>

- You can always check the status of your files by typing **git status**
