

## Steps to GitHub success

At the beginning of class:

- Pull from the upstream online GitHub repository with

- **git pull upstream master**

to get out of a merge message you may need this: **ESC : q return**

At the end of class:

- Save your changes the Git way with:

- **git add .**

- (the . adds all files that have been changed. You can

also write **git add** filename with an individual file)

- Push your changes to your online repository with

- **git push origin master**

Remember, to do any work in a Git repository, you must first navigate

to that repository in Terminal using **cd**.

If you forget to **add**, **commit** and **push** at the end of class, do that at the beginning of next class before you **pull**!
